XERISCAPE ECOLAWN has been developed as a very low growing, extremely drought tolerant grass/wildflower ground cover. This mixture has a very high ratio of wildflower to grasses and will flourish in low rainfall areas. This unique mixture of sod and clump grasses, legumes, and wildflowers has been designed to provide an ecological alternative to the typical turfgrass lawn, combining the best characteristics of drought tolerant grasses (predictable color, soil stabilization, aesthetics) with the beauty of wildflowers and the erosion protection and soil building aspects of clovers.
