Seeds per sq.ft.	260	

Native Meadow is designed to build natural habitat by combining native grasses and wildflowers chosen for compatible heights and staggered bloom seasons. The mix recreates the beauty of the native meadows early settlers encountered while also providing valuable forage for livestock and wildlife.

Establishment Guidelines:
Native species often take time to fully establish, and many will not reach maturity during the first growing season. During this initial year, consistent weed control and site maintenance are essential to ensure successful establishment.
